

ABSTRACT

The present invention aims at offering a mobile terminal capable of obtaining information related to the purpose of the caller who made
5 a communication request in an emergency or business situation while the connection to the communication request destination is not established. If determining that establishment of a communication connection requires time after a communication request to a telephone number registered to the channel select information table 901 stored in the
10 information storage unit 130 was made, the control unit 200 instructs the broadcast receiving unit 170 to receive broadcast according to a registered channel information piece in association with the telephone number in the channel information table. In addition, when a reply signal indicating that the establishment of the communication
15 connection is currently not possible, the control unit retransmits the request until predetermined number of retransmission is reached.
